Practitioner Clinical Updates

Special Feature: Autoimmunity

Calcium's Impact on Autoimmune Conditions

Is your client taking calcium? Or was their Hair Tissue Mineral Analysis test result high in calcium? It could be one of the contributing factors to developing autoimmune conditions. Patients with higher concentrations have been found to have higher susceptibility to viruses such as the Epstein Barr virus (responsible for Gladular Fever). Aside from over-supplementation, calcium storage can increase in the body in the presence of other factors; for example vitamin D, copper, estrogen or insulin.

Dr Watts, D Ph.D., Calcium and Virus Activation, TEI Newsletter, V3n.5, Nov-Dec 1989

Want to know more about calcium or other nutrients impacting the immune system? You MUST come to our seminar! See the box above and book today!
