

HAIR TISSUE MINERAL ANALYSIS

Nutrient and Toxic Element Testing

Provides vital nutritional information to help you get your health back on-track and maintain wellness in all stages of life!

Hair tissue mineral analysis is a non-invasive test measuring the levels of nutrients and toxic minerals found in hair. It can detect an excess or deficiency of nutrient minerals such as calcium, magnesium, zinc or copper and also identify over exposure to toxic metals such as arsenic, aluminium, cadmium, lead and mercury.

No two people are the same. HTMA enables you to adapt diet, mineral and vitamin supplements to meet the bio-individual needs of every person!

The *Gold Standard* in trace element pathology.

Our Hair Tissue Mineral Analysis Report measures minerals in parts per millions with the highest level of accuracy and reproducibility in the industry. The analysis and recommendations are comprehensive and informative, with expertise that comes from testing over 1.5 million samples.

The interpretive report provides a detailed nutritional health discussion of test results commenting on mineral balances, ratios, metabolic type, trends, dietary suggestions, potential food allergens, areas of concern (with possible contributing factors) and supplemental recommendations*.

*Please check information available on different profile reports; some information only provided on the Practitioner Reports.
